

BOT13 — Data Box & Field Reference

For the standalone BOT13 website. Every data box that references BOT13, the exact field it reads, and the formula behind it — Homepage first, then the BOT13 page. Built from the live frontend + engine code. Updated 2026-07-02.

0 · Where the data comes from

One JSON payload feeds everything:

```
GET https://<backend>/public/tracker/state?platform=bitbot13 → { "data": { ... } }
```

Path	Type	What it is
data.starting_capital	number	= number of coins × \$1,000 (bitbot13 = 50 → \$50,000)
data.funds.bot13.value	object	all the numbers (Current Value, P&L, holdings, trade log)
data.funds.bot13.current_strategy	object	today's decision, Edge Score, picks
data.snapshots[]	array	daily history [{date, bot13, oracle, wizard, ...}] — powers the track record + chart

Optional extra feeds for homepage context: `/public/tracker/signals?platform=bitbot13` (per-coin Buy/Sell/Hold) and `/public/tracker/news?platform=bitbot13` (filtered crypto news).

1 · HOMEPAGE — every box that references BOT13

1A. BOT13 Track Record tile (the flagship BOT13 box)

Computed entirely from `data.snapshots` — day-over-day BOT13 deltas. No extra endpoint.

Stat	How it's computed
Up days	count of days where bot13 rose > +0.05% vs the prior day
Down days	count of days where bot13 fell < -0.05% vs the prior day
Cash days	count of days between -0.05% and +0.05% (flat / no-edge)
Best day	max single-day % change: $\max(\text{bot13}[d]/\text{bot13}[d-1] - 1) \times 100$
Worst day	min single-day % change (same formula, minimum)

Needs ≥ 2 snapshots or it shows a “Fresh start” state. Down-day count must equal the number of negative daily deltas (audited).

1B. Live Leaderboard — Today (strip)

Field on page	Source	Formula
Name / kind	static (“BOT13” / “Daily intraday bot”)	—
Today %	<code>funds.bot13.value.day_pct</code>	$\text{day_pnl} \div \text{day_open} \times 100$ (color by day_pnl sign)

1C. The Race — BOT13 fund card

Box on card	Source	Formula
Current value	<code>funds.bot13.value.total</code>	<code>cash + pos_val</code>
P&L; \$ (“since inception”)	<code>funds.bot13.value.pnl</code>	<code>total – starting_capital</code>
P&L; %	<code>funds.bot13.value.pnl_pct</code>	$\text{pnl} \div \text{starting_capital} \times 100$
Today %	<code>funds.bot13.value.day_pct</code>	$\text{day_pnl} \div \text{day_open} \times 100$

1D. Performance Trajectory chart

BOT13 line = each `snapshots[i].bot13` (the fund's total / Current Value at that day's close) over time.

1E. Hero copy (context, not a data box): data.starting_capital and coin count (signals.universe_size, default 50). The parent lvl13.tech BOT13 P&L; box reads this same funds.bot13.value.pnl / pnl_pct.

2 · BOT13 PAGE (route #/fund/bot13)

2A. Header — 3 stat cards

Box	Source	Formula
Current Value	value.total	cash + pos_val
— sublabel “Started at \$X”	data.starting_capital	= number of coins × \$1,000
Total P&L; \$	value.pnl	total – starting_capital (since launch)
Total P&L; %	value.pnl_pct	pnl ÷ starting_capital × 100
Today's Change \$	value.day_pnl	total – day_open
Today's Change %	value.day_pct	day_pnl ÷ day_open × 100
(baseline)	value.day_open	value BOT13 started today at = prior day's close (= sc on day 1)

2B. Current Session's Strategy panel (current_strategy)

Element	Source	Notes
Period	current_strategy.day	“Day of YYYY-MM-DD”
Decision	current_strategy.decision	TRADE HOLD CASH. If it traded then closed out → “TRADED — closed for the day”
Projected Edge Score	current_strategy.projected_return	FROZEN pre-trade edge score (%). Must exceed 1.74% to trade. Never equals Today's Change.
Rationale	current_strategy.rationale	plain-English reason
Picks (grid)	current_strategy.picks[]	see below
traded_today	current_strategy.traded_today	keeps picks visible after close-out

Each pick: symbol, weight (0..1 → “Wt NN%”), score, rationale, indicators { mom_1d, mom_5d, mom_20d, mom_60d (momentum %), rsi_14, macd_pct }. On a true no-trade day the panel shows one “100% CASH — holding cash” card instead of picks.

2C. Current Holdings table (value.positions[])

Column	Field	Formula
Symbol	positions[i].symbol	—
Units	positions[i].shares	coins held
Entry	positions[i].entry_price	real price paid per coin at buy
Price	positions[i].price	current price
Value	positions[i].value	shares × price
Today	positions[i].day_pnl / day_pct	shares × (price – prior close); if bought today, Today = its Total P&L;
Total P&L;	positions[i].pnl	value – cost_basis (cost_basis = shares × entry_price)
%	positions[i].pnl_pct	(price ÷ entry_price – 1) × 100

Cash-state rows (driven by value.window_open / holding_cash / traded_today): session over → “End of trading session - holding cash” (if traded today) else “Holding cash - no edge”; session open but flat → “Holding cash - no edge”.

2D. Trade History — “Box F” (BOT13-ONLY, value.trade_log[])

Column	Field	Notes
Time	trade_log[i].ts	shown "h:mm AM/PM ET"
Action	trade_log[i].action	BUY (blue) or SELL (green if profit, red if loss)
Symbol	trade_log[i].symbol	coin
Units	trade_log[i].shares	coins traded
Price	trade_log[i].price	execution price
Realized P&L;	trade_log[i].realized	SELL rows only: (exit – entry) × shares
Note	trade_log[i].reason	e.g. "daily close-out", "rotation", stop

Sort: during session → chronological (SELL before BUY at same timestamp — closes free capital first); after close → BUY→SELL pairs ordered by each symbol's first buy time. Empty day → "No trades today" (never hidden for BOT13).

2E. BOT13 Track Record tile — same as 1A, also rendered at the bottom of the BOT13 page.

3 · Full BOT13 data dictionary

data.funds.bot13.value

```
total (Current Value = cash+pos_val) · cash · pos_val (Σ shares×price) · pnl (total–sc) · pnl_pct · day_pnl
(total–day_open) · day_pct · day_open · day_open_date · holding_cash (bool) · window_open (bool) · traded_today
(bool) · positions[] · trade_log[]
positions[i]: symbol · shares · entry_price · price · value · cost_basis · pnl · pnl_pct · day_pnl · day_pct
trade_log[i]: ts · action (BUY|SELL) · symbol · shares · price · realized · reason
```

data.funds.bot13.current_strategy

```
day · decision (TRADE|HOLD|CASH) · projected_return (frozen Edge Score %, >1.74% to trade) · rationale ·
traded_today · picks[] {symbol,weight,score,rationale,indicators{mom_1d,mom_5d,mom_20d,mom_60d,rsi_14,macd_pct}}
· proj_samples · proj_last_set · session_ended
data.snapshots[i]: { date, bot13, oracle, wizard, equalizer, titan } – each value is that fund's total that day.
```

4 · BOT13 rules the numbers must obey (for the new site's audit)

- Daily bot: buys at session open, sells everything before close; after close it is in cash (pos_val 0, cash == total, holding_cash true).
- Only trades on an edge: if the day's Projected Edge Score ≤ 1.74%, it holds cash — no trade, no risk.
- Total P&L; = since launch = total – starting_capital. Today's Change = today only = total – day_open.
- Day 1: Today's Change equals Total P&L; (both measured from starting capital).
- Fresh fund: on inception day it deploys exactly the starting capital, so Σ(cost_basis) == starting_capital (guards against a reset holdover).
- Edge Score is the frozen decision-time number for the day — it must never equal Today's Change.
- Every SELL in Trade History carries a realized P&L; every traded coin shows a BUY and a matching SELL by end of day.
- starting_capital = number of coins × \$1,000 (bitbot13 = 50 → \$50,000).
