

WallStBots — Data Box & Formula Reference

The source of truth for every number on every fund page. Updated 2026-07-02. Engines (refresh_*.py) BUILD the data to satisfy these formulas; the pages only display it. If a displayed number does not match its formula here, that is the bug — not the formula.

0 · Starting Capital

starting_capital (sc) = number of assets in the universe × \$1,000. wallstbots = 55 stocks → \$55,000. aistocks = 50 → \$50,000. bitbot13 = 50 coins → \$50,000. This is the amount each bot begins with and never changes.

1 · Fund Header — the 3 top boxes (same on the public fund page and the member fund page)

Box on page	Data field	Formula (what it MUST equal)
Current Value	value.total	cash + pos_val (uninvested cash + market value of all holdings)
"Started at" sublabel	starting_capital	= sc (number of assets × \$1,000)
Total P&L; (\$)	value.pnl	total – sc (SINCE LAUNCH — current value vs the starting capital)
Total P&L; (%)	value.pnl_pct	pnl ÷ sc × 100
Today's Change (\$)	value.day_pnl	total – day_open (today's profit/loss only)
Today's Change (%)	value.day_pct	day_pnl ÷ day_open × 100
(baseline for "today")	value.day_open	the value the fund STARTED today at = the prior trading day's close

First day: On a fund's first day there is no prior day to compare to, so the baseline for "Today's Change" is simply the starting capital (# assets × \$1,000). That means on day 1, Today's Change and Total P&L; come out to the same number — both are measured from the starting capital.

Cash vs invested: holding_cash = TRUE → pos_val == 0 and cash == total. pos_val > 0 → not holding cash. Signs must agree: sign(pnl)==sign(pnl_pct); sign(day_pnl)==sign(day_pct).

Holdover guard: a fund that starts fresh (or is just reset) deploys EXACTLY the starting capital, so on day 1 the sum of the holdings' cost basis == sc. If it doesn't, the audit flags a holdover.

2 · Holdings Table — one row per position (shown while invested)

Column	Data field	Formula / meaning
Units	shares	number of shares/coins held (> 0)
Entry	entry_price	the REAL price paid per share at the time it was bought (> 0). Never changed after purchase.
Price	price	current market price per share (> 0). Guard: price/entry must stay within 0.125×–8×.
Value	value	shares × price
(cost basis, behind Value)	cost_basis	shares × entry_price (what this position cost)
Today	day_pnl / day_pct	shares × (price – prior-day close). % = (price ÷ prior close – 1) × 100. If bought TODAY, Today = its Total P&L.;
Total P&L; (\$)	pnl	value – cost_basis
Total P&L; (%)	pnl_pct	(price ÷ entry_price – 1) × 100

Roll-up: pos_val (holdings market value) = sum of every row's Value. When cost basis == sc (a fund that hasn't compounded yet), the Holdings P&L; column sums to the Total P&L; box.

3 · Leaderboard (all-time period)

Box	Field	Formula
Each fund's P&L; (\$)	all_pnl	fund.total – sc
Each fund's P&L; (%)	all_pct	fund.pnl_pct
Grade / ranking	overall_grade	present; all 5 funds present

4 · Performance Chart / Snapshots

Item	Rule
Daily point	snapshot[date][fund] = that fund's total (Current Value) at that day's close
Today's point	present exactly once; dates strictly increasing; none dated in the future
Completeness	every snapshot carries all 5 fund keys; chart value == the fund card value

5 · BOT13 Track Record tile (computed from snapshots)

Stat	Formula
Up / Down / Cash days	counts of consecutive bot13 day-over-day deltas (positive / negative / flat)
Best / Worst day %	max / min of those daily % deltas
Integrity	the Down-day count must equal the number of negative deltas

6 · Today's Strategy box

Field	Rule
decision (oracle & wizard)	never HOLD — these two always deploy their full balance into picks
decision (bot13)	HOLD → pos_val must be 0 (it is in cash)
Projected Edge Score (bot13)	the FROZEN decision-time score for the day — NOT the live day return; must not equal Today's Change

7 · Member Fund Page (a member's copy, scaled to their capital)

Box	Field	Formula
Member starting capital	original_cost	member's universe size × \$1,000
Current Value	total_value	original_cost × (public fund.total ÷ platform sc)
Total P&L; (\$)	gain_loss	total_value – original_cost
Total P&L; (%)	gain_loss_pct	gain_loss ÷ original_cost × 100 (equals the public fund's pnl_pct)
Holdings rows	(per position)	same per-row reconciliation as the public page (Value=shares×price, etc.)
Member chart	total_value	last snapshot total_value ≈ live total_value

8 · BOT13 (crypto / intraday) — behaviour notes

BOT13 trades intraday and rotates within the session; it banks realized gains into its balance, and it sells everything before the session close, so after close it shows cash (pos_val 0, cash == total). Its Total P&L; is still Current Value – sc (since launch). Trade History (Box F) is BOT13-only.

How to use this: the standalone audit (Project/scripts/audit_integrity.py) checks every formula above against the live site and reports any box that doesn't match — including a holdover detector (cost basis ≠ starting capital on a fresh fund) and the day-1 check (Today's Change == Total P&L;). Run it, or read the daily 11am audit, before and after any change. If a number looks wrong, compare it to the formula here first; the fix is to make the number match the formula.
