

How the Bots Trade

Five disciplined strategies. One goal — outperform the market. Each bot runs fully automatically, evaluated against two independent baselines that never make a discretionary call.

ACTIVE TRADING STRATEGIES

INTRADAY · DAILY · 3x UPDATES

BOT13 - Precision Intraday Momentum

Vigilant. In a trade or in cash - never in a losing position without a reason.

BOT13 hunts the market's strongest single-day movers and only deploys capital when conditions clearly favor a winning trade. Three times each trading day (open, midday, close) it reassesses the full universe, logs every decision with a timestamp and rationale, then either enters the top 5 qualified movers or stands completely aside. The core mandate: be making money or be doing nothing.

ENTRY GATE >= 1.0% move	STOP-LOSS -1.5% hard
PROFIT TARGET +3.0%	MAX POSITIONS Top 5 names

- Market breadth gate: if >33% of stocks are down >2%, entire portfolio goes to cash
- Overextension penalty: moves >8% get 0.55x signal weight (reversal risk discounted)
- Signal-strength weighted allocation - bigger qualified movers get more capital
- Position weights clamped 12%-33% to prevent dangerous concentration
- Session log records every decision with time, phase, and full rationale
- Resets each morning - no stale overnight positions ever carried forward

WEEKLY · EVERY MONDAY

ORACLE - Adaptive Weekly Momentum

Five high-conviction names. Rebuilt every Monday with a clean slate.

Every Monday morning ORACLE scores the entire universe on four dimensions of momentum and quality, then builds a concentrated 5-name portfolio from the highest-scoring candidates. Positions are held for the week - no intraday noise, no emotional overrides. The model only enters names showing strength on both recent and intermediate timeframes simultaneously.

REBALANCE Every Monday	HOLDINGS 5 positions
QUALITY GATE 20d return > 0	SECTOR CAP Max 2 per sector

- Composite score: 5-day return (40%) + 20-day return (30%) + RSI quality (20%) + volume surge (10%)
- RSI penalty: names with RSI >75 score negatively - overbought is a risk, not a signal
- Sector diversification enforced - no single sector dominates the portfolio
- Score-proportional allocation with position weights clamped 12%-35%
- Positions carry mid-week; full recompute triggers each Monday morning run

MONTHLY · FIRST TRADING DAY

WIZARD - Quality Long-Horizon Momentum

Eight names. Built for the month. Weighted by conviction.

WIZARD thinks in months, not minutes. On the first trading day of each month it builds an 8-name portfolio anchored on risk-adjusted returns and trend quality. It rewards names that have performed well over 20 and 60 days, carry strong Sharpe-proxy scores, and are trading above their 50-day moving average. Sizing is quartile-tiered - the strongest picks carry the most weight.

REBALANCE Monthly	HOLDINGS 8 positions
QUALITY GATE 60d return > 0	SECTOR CAP Max 3 per sector

- Score: 20-day return (35%) + 60-day return (35%) + Sharpe proxy (20%) + 50d MA distance (10%)
- Quartile sizing: top 25% of picks get 3.0x weight, middle tier 1.8x, bottom tier 1.0x
- 60-day positive return required - broken-trend names are never admitted
- Intra-month monitoring: positions down >12% are flagged as stop-triggered
- Sector diversification enforced - max 3 names per sector in any portfolio

PASSIVE BASELINES - THE BENCHMARKS TO BEAT

PASSIVE · EQUAL WEIGHT · BUY & HOLD

EQUALIZER - The Pure Market Proxy

\$1,000 in every name. Zero discretion. Zero judgment.

EQUALIZER allocates exactly \$1,000 to every stock in the universe - no selection, no timing, no opinion. It represents what a purely diversified, opinion-free investor would earn. If the active bots cannot beat EQUALIZER consistently, the strategies need work. It is the harshest baseline because it removes all skill assumptions entirely.

- Exactly \$1,000 per position across all 55 stocks - zero discretion applied
- Never rebalances - initial positions are held from inception
- Benchmark question: does active stock-picking add value over pure diversification?
- Wins when the entire market rises uniformly - active bots must outperform in selective markets

PASSIVE · CAP WEIGHTED · BUY & HOLD

TITAN - The Institutional Proxy

Half the capital on heavyweights. The other half spread equally.

TITAN mirrors how large institutional portfolios are often constructed: half the capital concentrated in the top 10 highest-conviction heavyweight names (\$2,750 each), and the remaining half spread equally across the rest of the universe. It asks: does our active selection beat a simple size-tilted strategy?

- 50% of capital in top 10 heavyweights at \$2,750 each
- Remaining 50% split equally across all remaining names in the universe
- Static from inception - no rebalancing, no tactical moves ever made
- Benchmark question: does precision selection beat a cap-weighted tilt?
- Wins when large-cap leaders dominate - active bots must outperform when smaller names lead

AT A GLANCE - ALL FIVE FUNDS

FUND	TYPE	REBALANCE	HOLDINGS	KEY EDGE	ROLE
BOT13	Intraday Momentum	3x daily	Up to 5	Same-day explosive movers with hard risk controls	Active
ORACLE	Weekly Momentum	Every Monday	5	Multi-factor weekly leaders with sector balance	Active
WIZARD	Monthly Momentum	1st trading day	8	Risk-adjusted quality with conviction-weighted sizing	Active
EQUALIZER	Equal Weight Passive	Never	55 (all)	Pure market beta — zero selection bias	Baseline
TITAN	Cap-Weight Passive	Never	55 (all)	Institutional size tilt — heavy on market leaders	Baseline

Starting Capital: \$55,000 per fund | **Universe:** 55 curated stocks | **Data:** Live via GitHub Actions (market open | midday | close)

All strategies run fully automatically - no manual intervention required. Performance tracked from inception with real market prices, not simulations.
